

SmartClaim AI: Google Colab Streamlit Guide

A Step-by-Step Guide for Running the Dashboard on Google Colab

1. Uploading Files to Colab

Since Google Colab runs on a remote server, the first step is to get the project files onto that server. You can either:

- Upload the entire 'smartclaim' directory (including app.py, style.css, requirements.txt, src/, models/, and data/).
- Or, clone your GitHub repository directly into the Colab environment using the '!git clone' command.

2. Installing Dependencies

Create a new code cell in your Colab Notebook and run the following command to install Streamlit, Plotly, and the ML packages:

```
!pip install -r requirements.txt
```

3. Getting Your Colab IP Address

We will use LocalTunnel to expose the Streamlit port to the internet. LocalTunnel requires a security 'Endpoint IP' to prove you are not a bot. Run this code cell to get your Colab instance's public IP address:

```
import urllib.request
print('Password/Endpoint IP for LocalTunnel is:', urllib.request.urlopen('https://ipv4.icanhazip.com').read().decode('utf8').strip())
```

Copy the IP address that is printed out. You will need it in Step 5.

4. Running Streamlit and LocalTunnel

Create another cell and run the following commands. This runs Streamlit in the background and starts LocalTunnel:

```
!streamlit run app.py &>/content/logs.txt &
!npx localtunnel --port 8501
```

5. Accessing the Dashboard

- After running Step 4, it will output a link that looks something like: **https://some-random-words.loca.lt**
- Click that link to open it in your browser.

- A warning page will appear asking for an 'Endpoint IP'.
- **Paste the IP address** you copied from Step 3 and click 'Submit'.
- The SmartClaim AI Dashboard will now load!
